

Browser \rightarrow Every HTML element in Rectangular box
Padding \rightarrow Content k around space.
Margin \rightarrow Element k around space.

Height and width jo hum dete hai, that affects the content area.

Content Height = 5 } Total height = Content H + Padding + Border + Margin
content width = 5 } Total width = Content W + Padding + Border + Margin

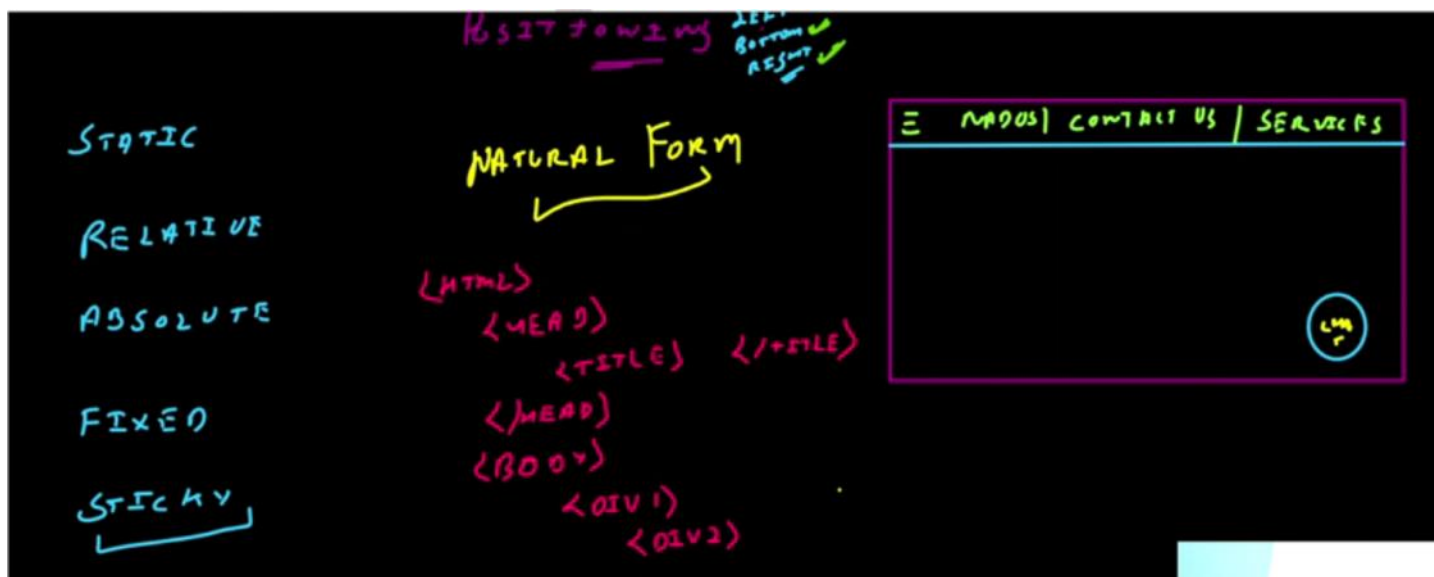

Block → `div, h1, h2, p` } Occupies full width (line breaks) ^{→ start & end both}
(we can set height & width however it still occupies complete space)

Inline → `span, a, img` } Only required width is occupied. (no line breaks)
ht width x

Inline-Block → ht, width ✓
+ inline

Positioning

12 June 2022 20:24

We can position literally everything on a web page using Left, right, top and bottom.

Static: This is the default position. Normal flow follows. TLBR (Top Left Bottom Right) property is not followed.

Relative: TLBR works here and the normal flow is maintained.
